

# Tasking Framework

## Parallelization of Computations in Onboard Control Systems

Knowledge for Tomorrow

# Overview

- Introduction
  - Future Challenges in Space Application
  - Sensor Data Fusion
  - ASAP Scheduling
- Tasking Framework
  - Principal
  - Elements
  - Process
- OBC-NG (On-Board Computer – Next Generation)
  - Redundancy Concept
  - Reconfiguration
  - Configuration DSL

# Introduction: Future Challenges in Space Application

- Onboard data processing
  - Reduce amount of data
  - Preprocessing of scientific data
    - Scientific Products
    - Catastrophe Management
    - Onboard Planning
- Optical Sensor Systems
  - Image Processing
    - Rectification
    - Object Identification
    - Feature Tracking
    - Optical Flow
    - Stereo Matching

DLR: Firebird

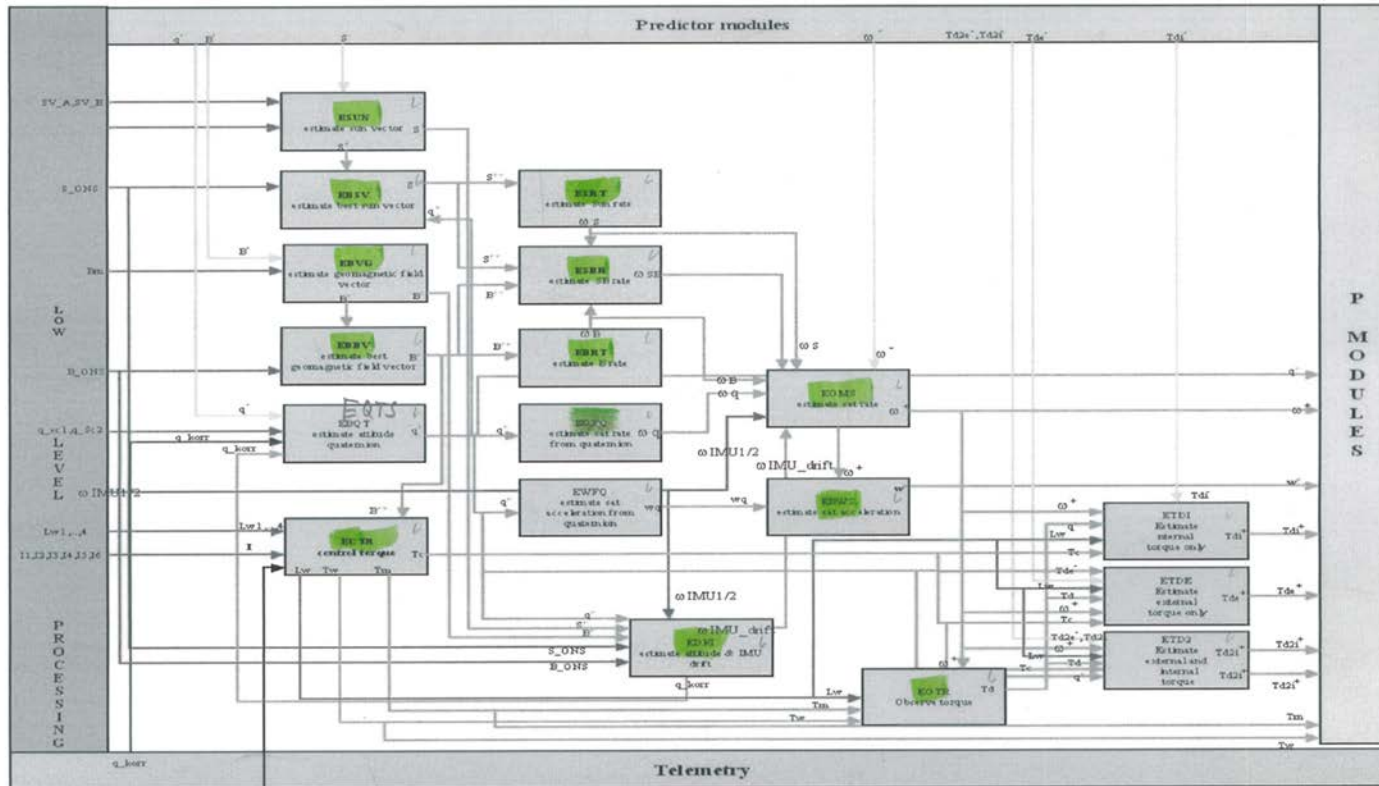

DLR: ATON

# Introduction: Sensor Data Fusion

The BIRD ACS "E module(s)"

Commanded 4 wheel torques from tetrahedron and commanded coil current values

Remarks:  
 Any predicted or estimated value consists of the value and its variance  
 Any module with a **bold** printed module name can run, before star camera data are available.  
 The enable/disable flags will never stop the module but disable the module output. Therefore all modules are running all the time.

# Introduction: ASAP scheduling

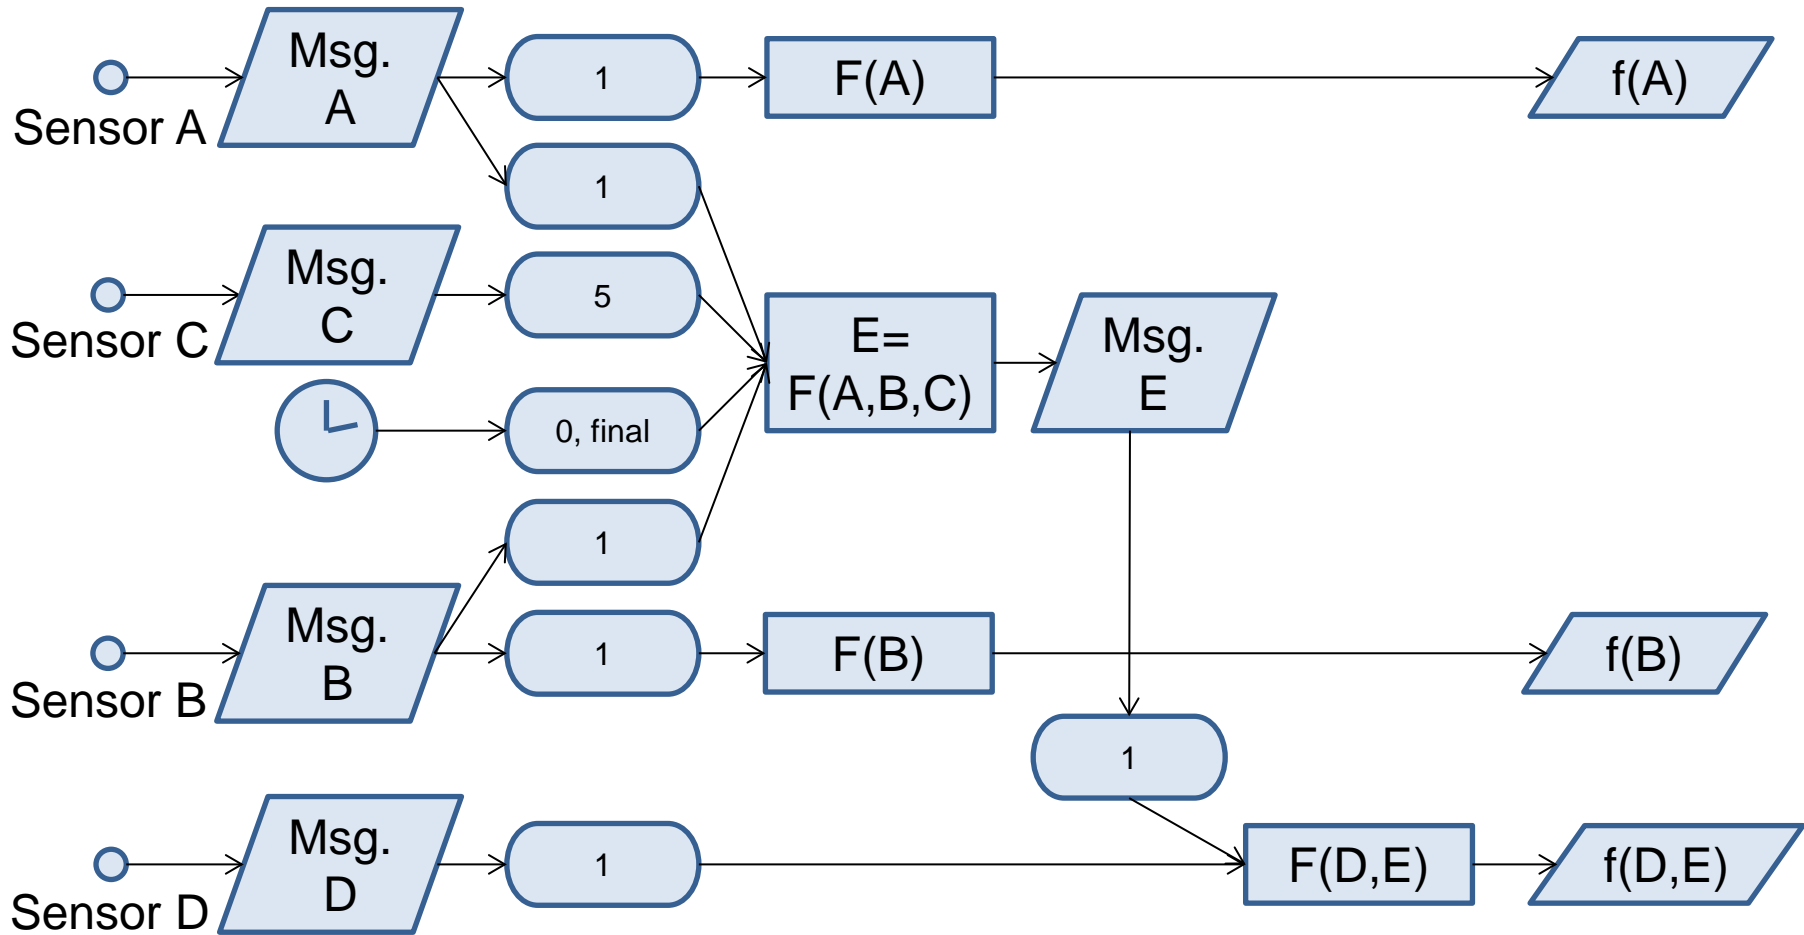

Conserative scheduling in one code block:

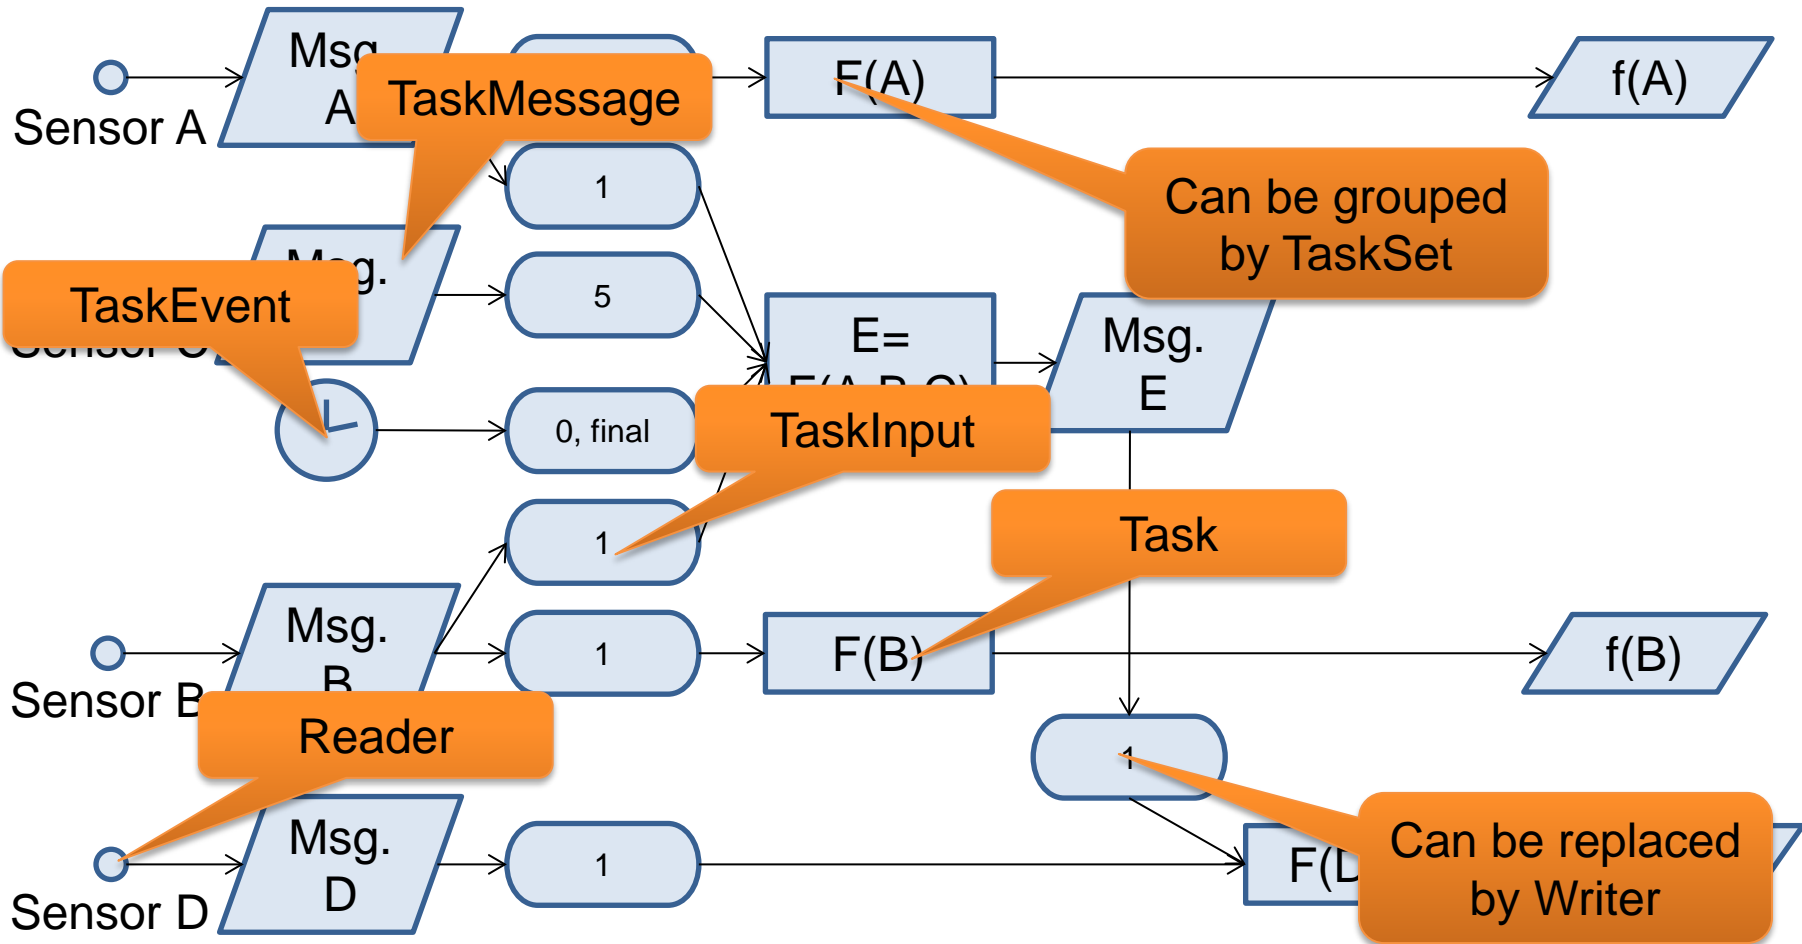

Tasks with ASAP scheduling:

# Tasking Framework: Principal

# Tasking Framework: Elements

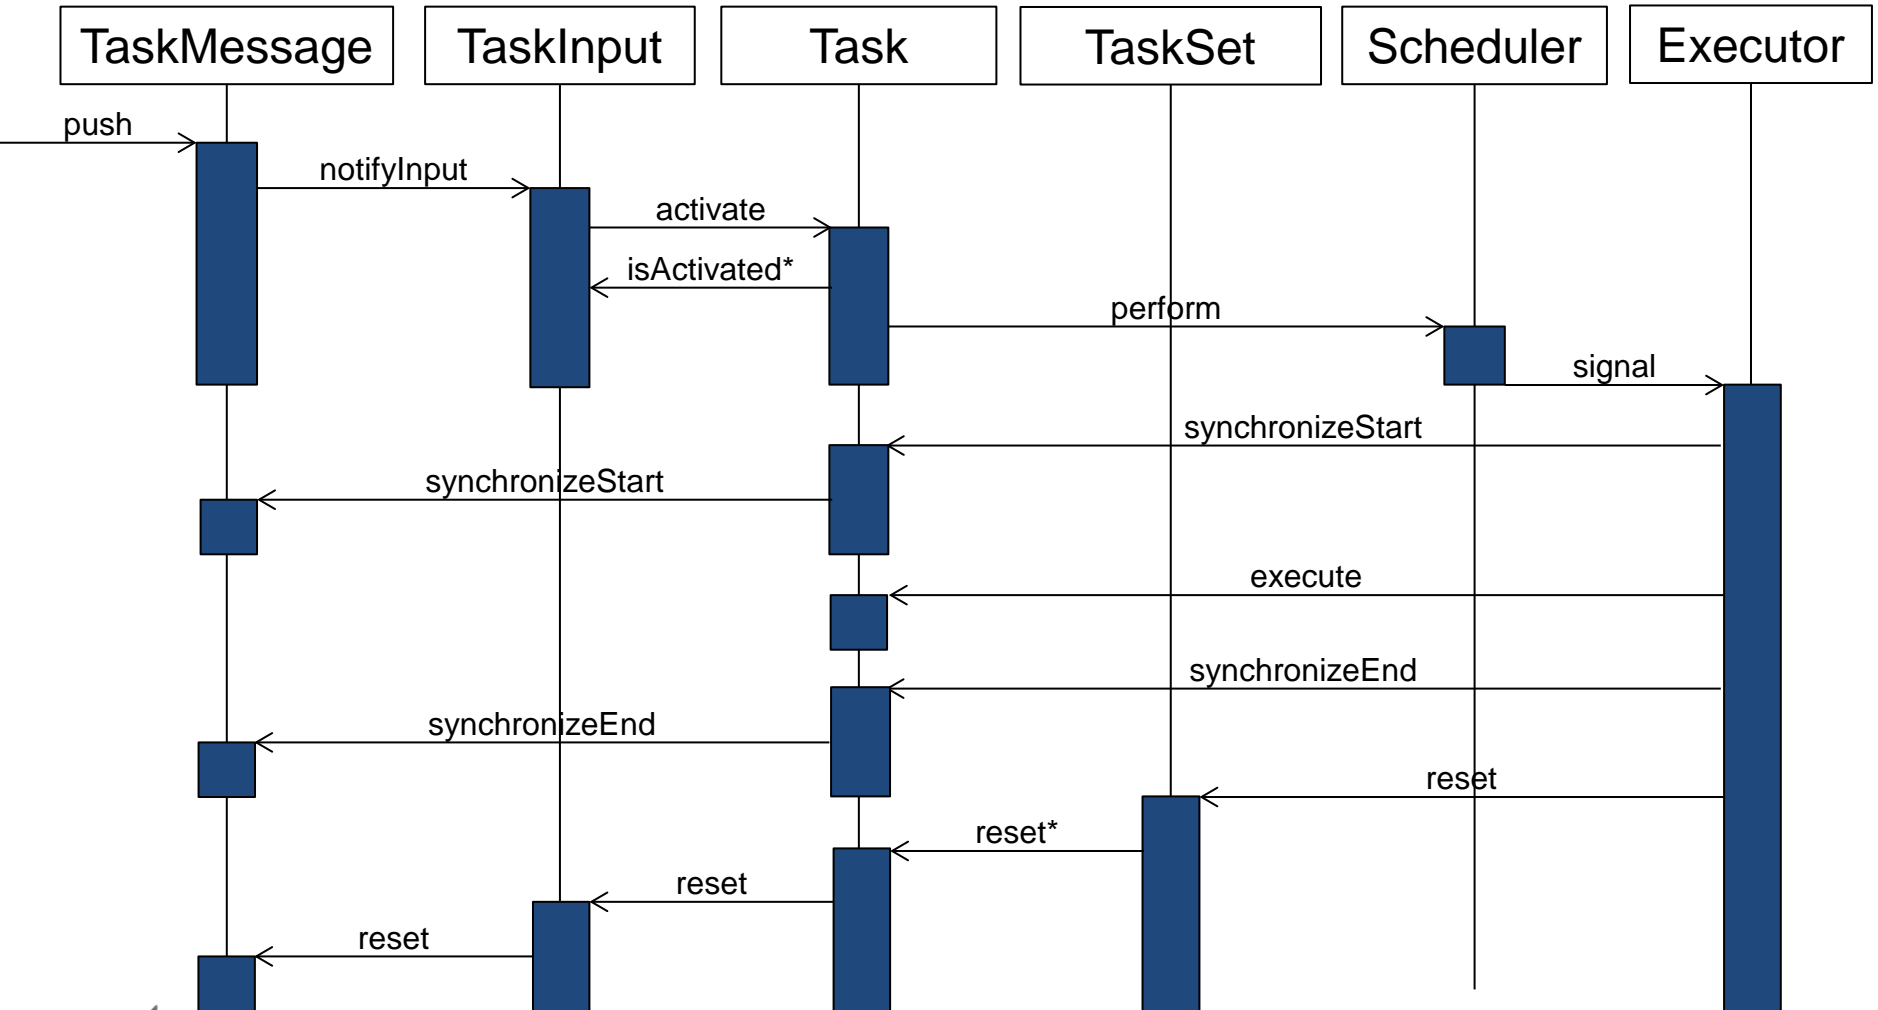

# Tasking Framework: Example

# Tasking Framework: Process

# OBC-NG: Redundancy Concept

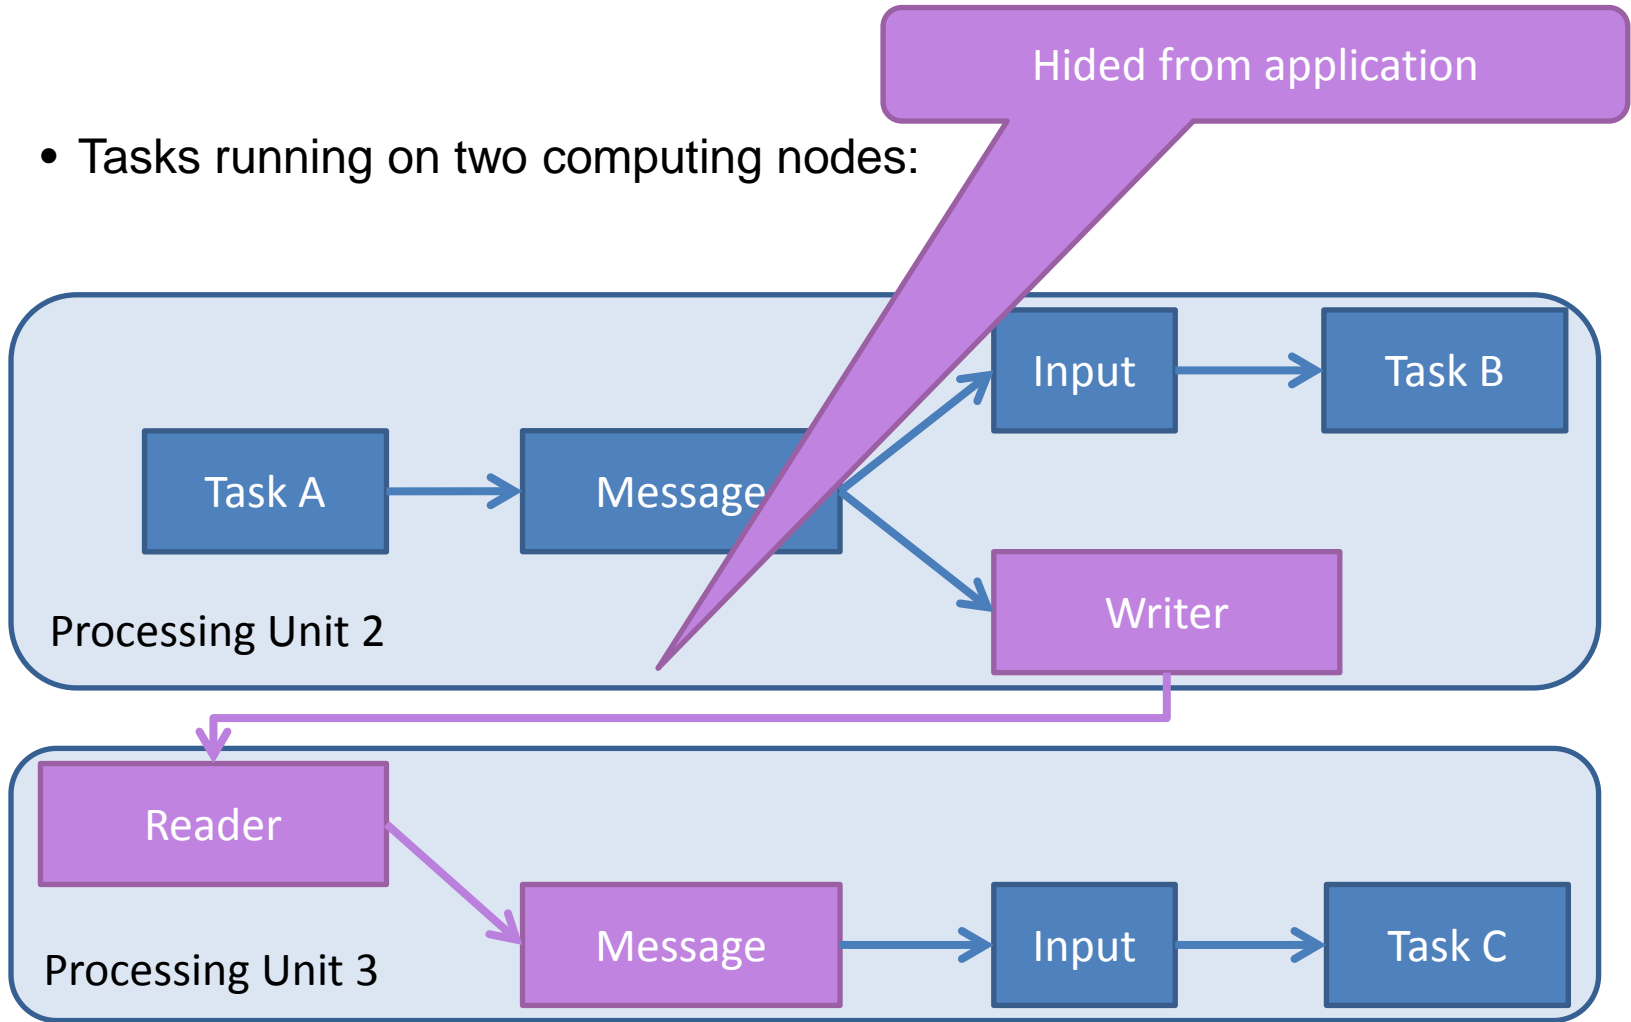

# OBC-NG: Task Reconfiguration

- Tasks running on one computing node:

# OBC-NG: Task Reconfiguration

- Tasks running on two computing nodes:

# OBC-NG: Task Concept Configuration DSL

- Name the tasks
- Name the messages
- Assign messages to tasks
  - Input messages (number of arrivals/final flag)
  - Output messages
- Distribute tasks over processing nodes
  - for different node configurations
  - for mission phases

# Conclusion and Outlook

- Tasking Framework
  - Data and event driven scheduling
  - Low management overhead
  - Petri Net oriented way → Good way to parallelize computations
  - Proved in one complex software currently (ATON)
- OBC-NG
  - Configuration by DSLs
  - Reconfiguration Concept
  - Easy to set up redundant on-board computations
  - Applicable for heterogeneous distributed systems
- On-going work
  - Design of hardware and software for OBC-NG
  - Apply Tasking Framework in a flight software (Planned launch 2016)
